

Roman blinds are an ideal choice for square bay windows. As the material hides the mechanics of the blinds, all you see is the fabric that you selected. By following this guide to measure the bay, your blinds should be sized such that they will almost meet in the corners without overlapping. This means that all three blinds will operate smoothly.

The 'Depth' of your chosen blind is simply the distance the blind sticks out from where it's fitted. You'll need to know this depth to make the correct allowances when measuring. This table provides the depths for our Roman blinds:

Blind Type	Depth
Roman Blind	50mm

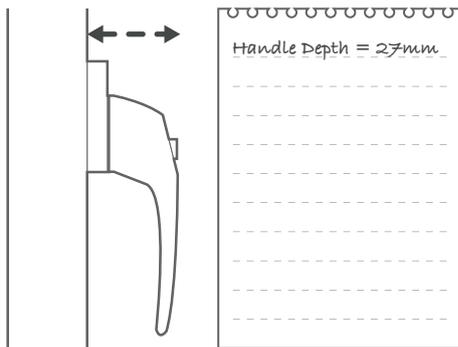

Top-Tip

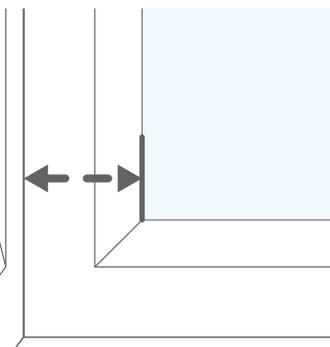

Always check the width of each window in three places, just as you would for an ordinary recessed window. Bay windows are prone to movement and you may find that the widths vary even if at first glance they all look the same. It is always the smallest of three measurements that you should be working with. **Always use a metal tape measure when measuring.**

1

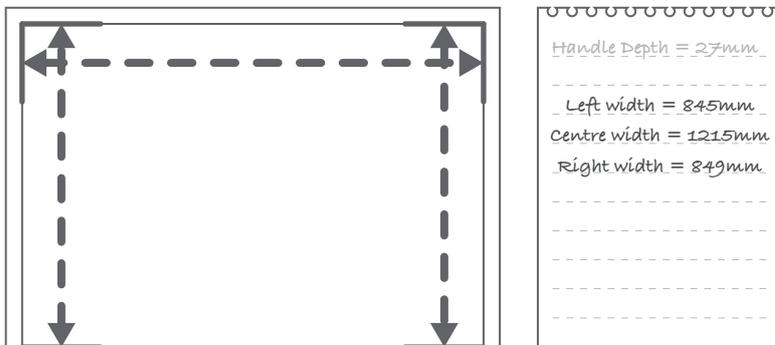

MEASURING

Then, measure how far any obstructions (such as window handles) protrude from the frame. You'll need to add this measurement to your blind depth. **You need to account for obstructions on all three windows.**

It's important to make sure that your blinds will provide adequate privacy and shading, so for this option, measure the width of your window frames, from the corner to the glass. If this measurement is less than the total depth (blind depth + obstruction depth) you're allowing for each blind, then you'll need to choose options 1 or 3 instead.

Measure the full width of all three windows, right into the corners of the frame. Make sure you measure the sides separately, as they can vary in width slightly.

Measuring the drop is simple, just measure from the top of where the blinds will be fitted, down to where you'd like the bottom to rest (usually the sill).

Handle Depth = 27mm
Left width = 845mm
Centre width = 1215mm
Right width = 849mm
Drop = 1230mm
Blind Depth = 50mm
TOTAL Depth = 77mm

Now that you have all of your measurements, you can make the necessary adjustments you'll need to order. First, add your blind depth to your handle depth. **This total depth is going to be the distance from the window frame to the front of the blinds.**

For this option, you'll be reducing the width of all three blinds, as each needs to make space for the others next to it. You'll reduce the side blinds by 1x your total depth (each) and the centre blind by 2x the total depth (as the centre blind is making space for a blind at each side). The drop does not need to be adjusted.

CENTRE: Corner-to-Corner - Total Depth x2 = Width to Order | Select 'Exact Fitting'

LEFT / RIGHT: Corner-to-Corner - Total Depth x1 = Width to Order | Select 'Exact Fitting'

EXAMPLE

	Corner-to-Corner	Total Depth	Width to Order	
CENTRE BLIND:	1215mm	- 77mm x2	=	1061mm Exact Fitting
LEFT BLIND:	845mm	- 77mm	=	768mm Exact Fitting
RIGHT BLIND:	849mm	- 77mm	=	772mm Exact Fitting
